Continuation of 11. does NOT place the application in condition for allowance because: the combination of Smith with Toner and/or Delmotte is still considered to be proper. The Toner reference clearly discloses that fibrin, when applied to a polymer substrate, will enhance cell immobilization to the polymer substrate. Since Smith teaches that cell adhesion to the walls of the container is beneficial, it is believed that one of ordinary skill in the art would be motivated by Toner to line the interior of Smith's apparatus with a fibrin matrix. The Toner reference is being considered as a whole in regard to its teachings regarding fibrin and the ability of fibrin to stimulate cell immobilization. The use of gas permeable sidewalls is related to the delivery of critical gases to and from the interior of the vessel, and therefore is drawn to a subject area that is entirely different than the formation of a cell immobilization matrix. There is no reason to believe that the fibrin matrix disclosed by Toner is dependent on the use of gas impermeable sidewalls. Since Smith already discloses the use of gas permeable sidewalls and their corresponding benefits, it would have been unnecessary to change the construction of Smith's sidewall material when introducing the fibrin layer.
